             from analysis of cytochrome b gene sequences.";
Mol. Phylogenet. Evol. 9:192-203(1998).

-i- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

-i- COFACTOR: TWO HEME GROUPS (B562 AND B566) WHICH ARE NOT COVALE
BOUND TO THE PROTEIN (BY SIMILARITY).

-i- SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

-i- SIMILARITY: BELONGS TO THE CYTOCHROME B/B6 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Craniata; Verte Actinopterygii; Neopterygii; Teleostei; Eutel Acanthomorpha; Acanthopterygii; Percomorpha; Cichlidae; Parachromis.

C FERROCYTOCHROME C.

C -1 COFACTOR: TWO HEME GROUPS (B562 AND B566) WHICH ARE NOT COVALENTLY

C BOUND TO THE PROTEIN (BY SIMILARITY).

C -1 SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,

C CYTOCHROME C1 AND THE RISKE PROTEIN (BY SIMILARITY).

C -1 SIMILARITY: BELONGS TO THE CYTOCHROME B/B6 FAMILY.

The modified peptides are characterized in that at least one of the 2nd, 4th, 5th, 12th, 20th and 22nd amino acids of the enterotoxin II signal peptide is replaced by another amino acid, and at least 1 of the 2nd and 4th amino acids of the modified peptide is lysine. The modified signal peptide enhances the efficiency of peptide secretion from the cells. The modified signal peptides may be used according to standard recombinant DNA methodologies to direct the secretion of peptides from microorganisms. In particular, it may be used to direct the secretion of human growth hormone from E. coli
This sequence is encoded by an extended human secreted protein coding sequence of the invention. The secreted proteins can be used in treat or controlling a variety of human conditions. The secreted proteins \mathbf{m}

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     act as cytokines or may affect cellular proliferation or differentiation or may act as immune system regulators, haematopoiesis regulators, tissue growth regulators, regulators of reproductive hormones or cell movement or have chemotactic/chemokinetic, receptor/ligand, anti-inflammatory or tumour inhibition activity. The DNAs can be used in forensic procedures to identify individuals or in diagnostic procedures to identify individuals or in diagnostic procedures to identify the system of the genes corresponding to the extended cDNAs. They are also useful for constructing a high resolution map of the human chromosomes. They can also be used for gene therapy to control or treat genetic diseases.

                The present sequence represents a Staphylococcus aureus protein, that, based on homology is believed to be a membrane-associated component of a branched amino acid transport system. The DNA sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the Control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Staphylococcus aureus protein; ribozyme; Staphylococcal gene; regulatory element; vaccine; Staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infection; food processing the staphylococcal infectio

                                                                                                                                      human secreted proteins, and encode the proteins given in AAY12987 to AAY13219, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/ chemokinetic activity, haemostatic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; secreted protein; EST; expressed sequence tag; diagnosis; forensic; gene therapy; chromosome mapping; signal peptide; upstream regulatory sequence; cytokine activity; cell proliferation; differentiation; haematopoiesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition.
              thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                    AAX51787 to AAX52019 represent 5' expressed sequence tags (ESTs) for human secreted proteins, and encode the proteins given in AAX12987 to

                                                                                                                            The Invention relates to a vertebrate-derived protein containing an amino acid sequence shown in ANY27137 and ANY27139. The vertebrate-derived protein has at least 55 % homology to one of sequences shown in ANY27141-Y27143, and has slit protein-like activity. The vertebrate slit proteins encoding nucleic acid sequences have at least 60% homology to nucleic acid sequences ANX89161-163. The vertebrate-derived proteins can be produced recombinantly by transforming host cells with expression vectors comprising the encoding nucleic acids. The proteins of the invention are for diagnosing and treating cancer of the nerves, muscle and/or endocrine system.

AAB63221 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding breast, gastric and prostate cancer associated antigen precursors, useful for diagnosing and treating a condition characterized by expression of an abnormal amount of a protein, e.g.
                                     Human; colon cancer; colon cancer antigen; diagnosis;
colorectal carcinoma; chromosome 11.

The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P capression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing conactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB37789 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The LMRP nucleic acids can be used to modify lipids and fatty acids, cofactors and enzymes in microorganisms and plants, particularly to produce polyunsaturated fatty acids, and are especially useful in oilseed plants. The nucleic acids may also confer biotic or abiotic stress tolerance, particularly to maize, wheat, rye, oat, triticale, rice, barley, soybean, peanut, cotton, rapeseed, canola, manihot, pepper, sunflower, tagetes, potato, tobacco, eggplant, tomato, Vicia species, pea, alifalfa, coffee, cacao, tea, Salix species, oil palm, coconut, perennial grasses and forage crops. AAH50878 to AAH50882 represent primers used in the exemplification of the present invention. AAH50883 to AAH50968 represents LMRP nucleotide sequences, and AAG80843 to AAG80928 represent LMRP protein sequences, given in the present invention.
                                                                                                                                                                                                                                                                                   AAG83349 standard; Protein; 181 AA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of a number of moss ligid metabolism related proteins (LMRPs). The moss Physcomitrella patens is one of the few plants able to produce polyunsaturated fatty acids, and the sequences can be used to create transgenic plants also capable of producing them. They can also be used to identify the presence of P. patens and in the production of fine chemicals. The present sequence is one of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lerchl J,

        The invention relates to human polynucleotides (AAI63803-AAI64012) and the encoded proteins (AAM34497-AAM43660) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes were isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative
                                                                                                                                                                              Claim 11;
                                                                                                                                                                                                       New isolated nucleic acids and polypeptides, useful for diagnosing, treating and/or preventing human diseases and disorders - \,

AAD08404-AAD08478 represent cDNAs corresponding to 24 human secreted CC protein genes, and AAE04100-AAE004170 represent the proteins they encode. AAE04172-AAE04197 represent they encode in the conditions and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. CC Pathological conditions can be diagnosed by determining the amount of the conditions can be diagnosed by determining the amount of the conditions can be diagnosed by determining the amount of the conditions in the new genes. Specific uses are described for each of the 24 genes, consear tumours, foetal and developmental abnormalities, themselves concern tumours, foetal and developmental abnormalities, and include disorders, cancer, tumours, foetal and developmental abnormalities, and include conditions of the inmune system, AIDS, autoimmune consideration of the invention, in the condition of the invention, in the condition of the invention   AAE04125

or ameliorating medical conditions, e.g., by protein or gene therapy.

CC or ameliorating medical conditions, e.g., by protein or gene therapy.

CC Pathological conditions can be diagnosed by determining the amount of the conditions of the presence of mutations in the way genes. Specific uses are described for each of the 24 genes, conditions in the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative conditions, cancer, tumours, foetal and developmental abnormalities, conditions (e.g., rheumatoid arthritis), inflammation, allergies, concursionates (e.g., Alzheimer's disease, Parkinson's disease), concursionates (e.g., Alzheimer's disease, Parkinson's disease), conjuitive disorders, schizophrenia, asthma, skin disorders (e.g., conjuitive disorders, schizophrenia, asthma, skin disorders (e.g., prejnancy-related disorders, atherosclerosis, cardiovascular disorders, consideration, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, considerative to modify storage properties. Antibodies specific for a protein of the invention can be used as a food additive or protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., the present sequence represents a human secreted protein of

cc antifheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cc cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; cc fungicide; and ophthalmological. The polynucleotides and proteins can be used to prevent, treat or ameliorate a medical condition in e.g. humans, cc mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a cpathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative cd disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. The polypeptides can also be used to disease, infections caused by bacteria, viruses and fungi and ocular cd disorders e.g. corneal infection. The polypeptides can also be used to ading due to sunburn, to maintain organs before transplantation, for caping due to sunburn, to maintain organs before transplantation, for comporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or present invention.

CC preservative to increase or decrease storage capabilities. AAF22364 to the present invention.

This sequence corresponds to residues 10-13 of the peptide represented by AAR85068. The peptides suppress blood pressure by inhibiting the calcium influx into cells. These peptides can be used in a hypotensive
                                                                    New fusion immunoglobulin heavy chain including gpl20 epitopes and related complete antibodies - DNA, vectors and transformed cells, used to induce tolerance to the epitopes for treatment of human immune deficiency virus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW76946 standard; peptide; 3

The present peptide represents a proteinase site used in the creation of the bone morphogenetic fusion proteins of the invention. The bone morphogenetic fusion protein some or all of the following elements: a purification tag, a proteinase site, an ECM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment. The fusion proteins of the invention also includes proteins that have transforming growth factor beta active fragments instead of bone morphogenetic protein active fragments. The bone morphogenetic fusion proteins can be used for enhancing wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     proteins can be used against other diseases where an immune response is deleterious, e.g. microbial infection, tumours or autoimmune disease. Induction of tolerance suppresses production of antibodies against gpl20, so prevents or inhibits 'bystander' apoptosis of unifected T cells that are bound to gpl20 protein, maximising induction of protective antiviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    immune deficiency virus (HIV) gpl20 epitopes. Fusion Ig proteins and/or transfected cells are used to tolerise subjects to gpl20 epitopes and to maintain this tolerance, particularly for treatment of HIV infection, optionally together with other therapeutic/prophylactic agents such as vaccines, chemotherapeutic agents and immune response modifiers. Such
                                                                                                                                                                                                                                                                       WPI;

                                                                                                The invention provides diagnostic markers for a human disorder, comprising either opiate-like peptides or opiate-derived peptides. The novel peptides are used as diagnostic marker, in ex-vivo methods of diagnosing human disorders e.g. autism spectral disorders including autism pervasive developmental disorder. Aspergers syndrome, attention deficient disorder and attention hyperactivity disorder, and multiple sclerosis, Parkinson's disease and Alzheimer's dementia. Sequences AAY49371-413 represent peptide diagnostic markers for the human

                                                                                                                                                                                                            Peptides covered by this sequence are preferred examples of a highly generic formula for peptides with analysis and antipsychotic properties. The peptides also have Growth Hormone releasing and prolactin releasing properties. When the N-terminus is not Boc-protected, the peptides are in the form of their hydrochloride (i.e. -NHNHZ) or dihydrochloride (i.e. -NHNHZ) salts.
                                                                                                                                                                                                                                                                                                                                           Analgesic and antipsychotic polypeptide(s) - also useful in neuro endocrinology and to stimulate liberation of growth hormone and prolactin
                                                                                                                                                                                    Sequence
